## **Abstract**

Abstract: We investigated whether H<sub>2</sub>O<sub>2</sub>, superoxide, and ERK participate in nerve growth factor (NGF)-induced signaling cascades and whether antioxidant N-acetylcysteine (NAC) regulates these NGF-induced responses. PC12 cells were cultured in medium containing NGF or vehicle with or without NAC pretreatment, and the intracellular H<sub>2</sub>O<sub>2</sub> and superoxide levels and the amount of phosphorylated ERK were evaluated by flow cytometry and Western blotting, respectively. We found that NGF increased intracellular H<sub>2</sub>O<sub>2</sub> concentration and activated ERK but failed to affect intracellular superoxide level. Moreover, NAC counteracted these NGF-induced responses. These findings demonstrate that NAC blocks the NGF-induced H<sub>2</sub>O<sub>2</sub>/ERK signaling in PC12 cells
