摘要

Abstract

Leiomyoma is a rare benign mesenchymal tumor of the urinary bladder. However, its treatment is simple and the outcome is excellent. It is noteworthy that at preoperative diagnosis it is not always apparent. We report a case of leiomyoma of the urinary bladder in a 33-year-old man. A series of imaging studies including intravenous urography, transabdominal ultrasound, cystoscopic examination, computed tomography and magnetic resonance imaging are done for preoperative evaluation. The radiological findings of this rare entity at preoperative diagnosis will be discussed
