摘要

## **Abstract**

Retrocaval ureter is a rare congenital venous anomaly. Herein, we report two cases of retrocaval ureter with right lower quadrant abdominal pain and right flank pain, respectively. Imaging studies confirmed the diagnosis. Segmental resection of the ureter with end to end anastomosis was done. The post-operative course was uneventful. (J Urol R.O.C., 11:134-7, 2000)
