

Cranial nerves and their nuclei

鄭海倫 整理

Cranial Nerves

(a)

Figure 13.4a

Location of the cranial nerves

- Anterior cranial fossa: C.N. 1–2
- Middle cranial fossa: C.N. 3-6
- Posterior cranial fossa: C.N. 7-12

Functional components in nerves

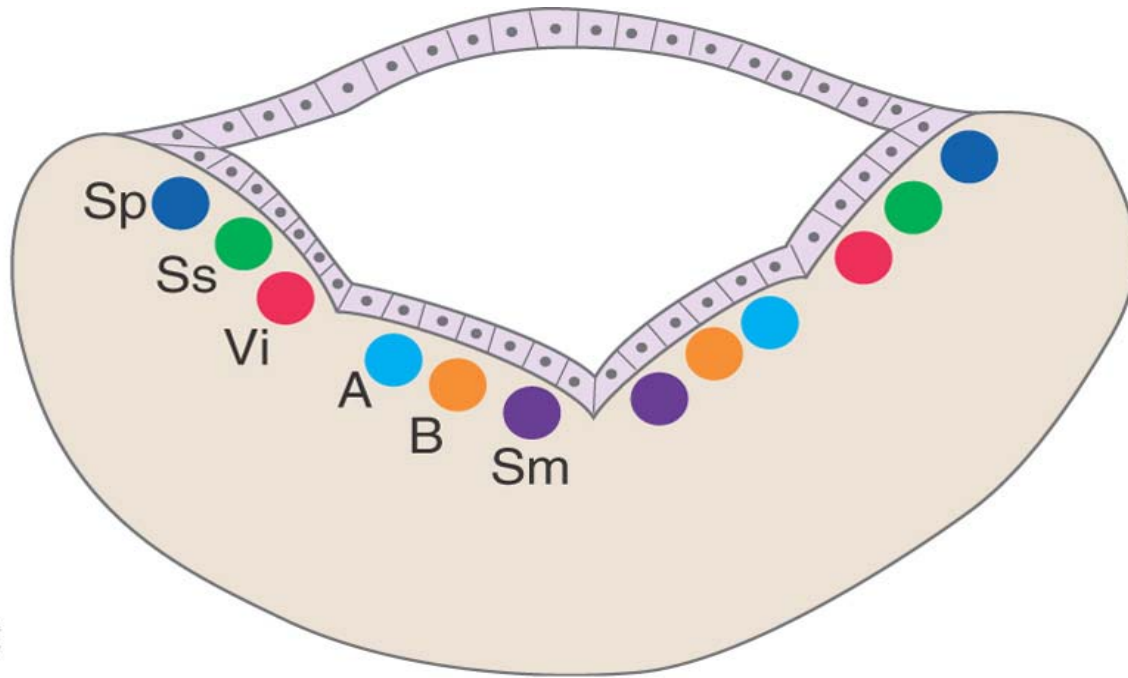

- General Somatic Efferent
- Special Visceral Afferent
- GSE GSA GVE GVA
- (SSE) SSA SVE SVA

Neuron columns in the embryonic spinal cord

The floor of the 4th ventricle in the embryonic rhombencephalon

Sp: special sensory

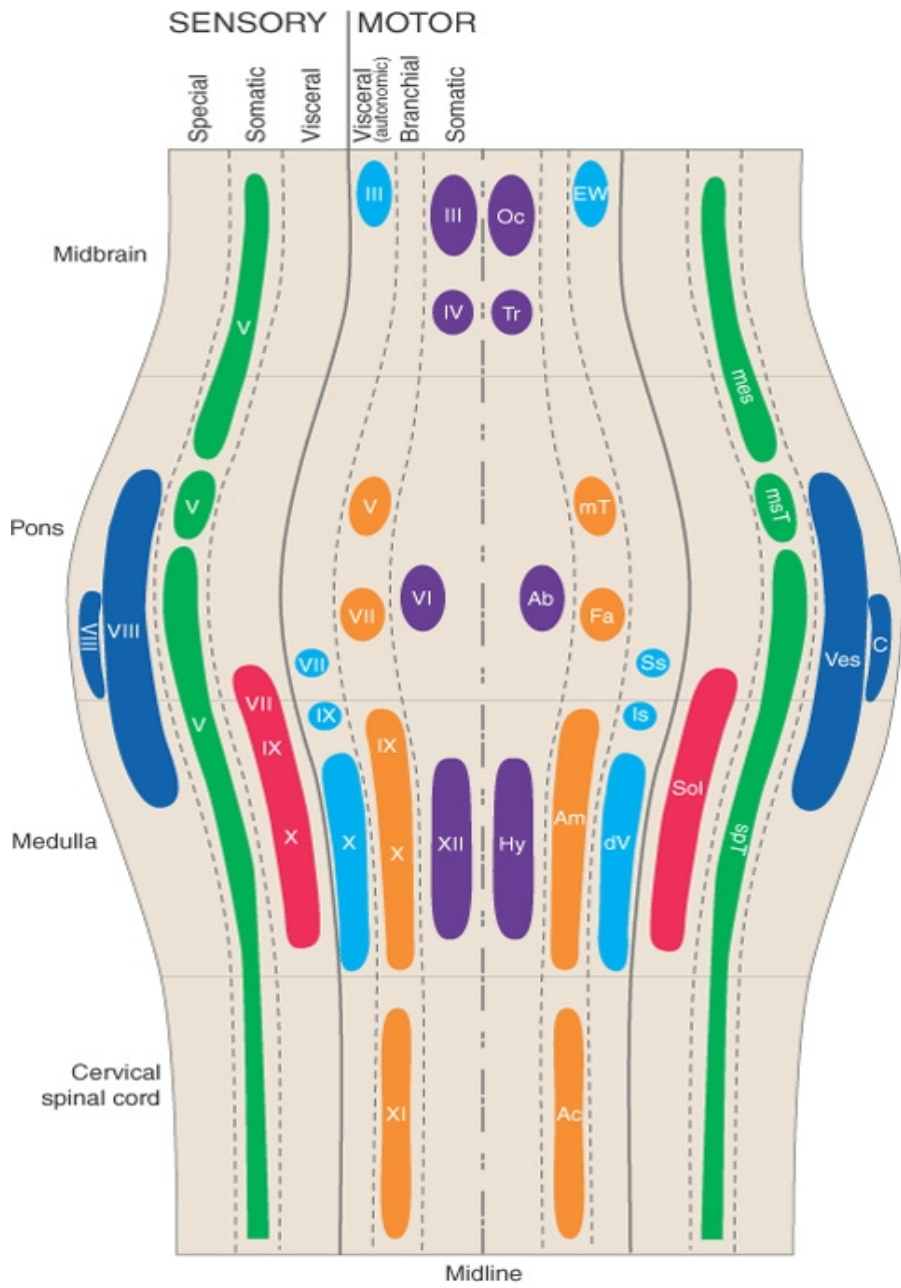

Ss: somatic sensory

Vi: visceral sensory

A: preganglionic autonomic (visceral motor)

B: branchial motor

Sm: somataic motor

(Modified from Nieuwenhuys R et al: The human central nervous system: a synopsis and atlas, ed 3, New York, 1988, Springer-Verlag.)

- STT: spinothalamic tract
- CST: corticospinal tract
- ML: medial lemniscus

Sensory nerve

- Olfactory (1)
- Optic (2)
- Vestibulocochlear (8)

Motor nerve

- Oculomotor (3)
- Trochlear (4)
- Abducens (6)
- Accessory (11)
- Hypoglossal (12)

Mixed nerve

- Trigeminal (5)
- Facial (7)
- Glossopharyngeal (9)
- Vagus (10)

Innervation of branchial muscles

- Trigeminal
- Facial
- Glossopharyngeal
- Vagus

Cranial Nerve I: Olfactory

Cranial Nerve II: Optic

- Arises from the retina of the eye
- Optic nerves pass through the optic canals and converge at the optic chiasm
- They continue to the thalamus (**lateral geniculate body**) where they synapse
- From there, the **optic radiation** fibers run to the visual cortex (**area 17**)
- Functions solely by carrying afferent impulses for vision

Cranial Nerve II: Optic

Cranial Nerve III: Oculomotor

- Fibers extend from the ventral midbrain, pass through the superior orbital fissure, and go to the extrinsic eye muscles
- Functions in raising the eyelid, directing the eyeball, constricting the iris, and controlling lens shape

Cranial Nerve III: Oculomotor

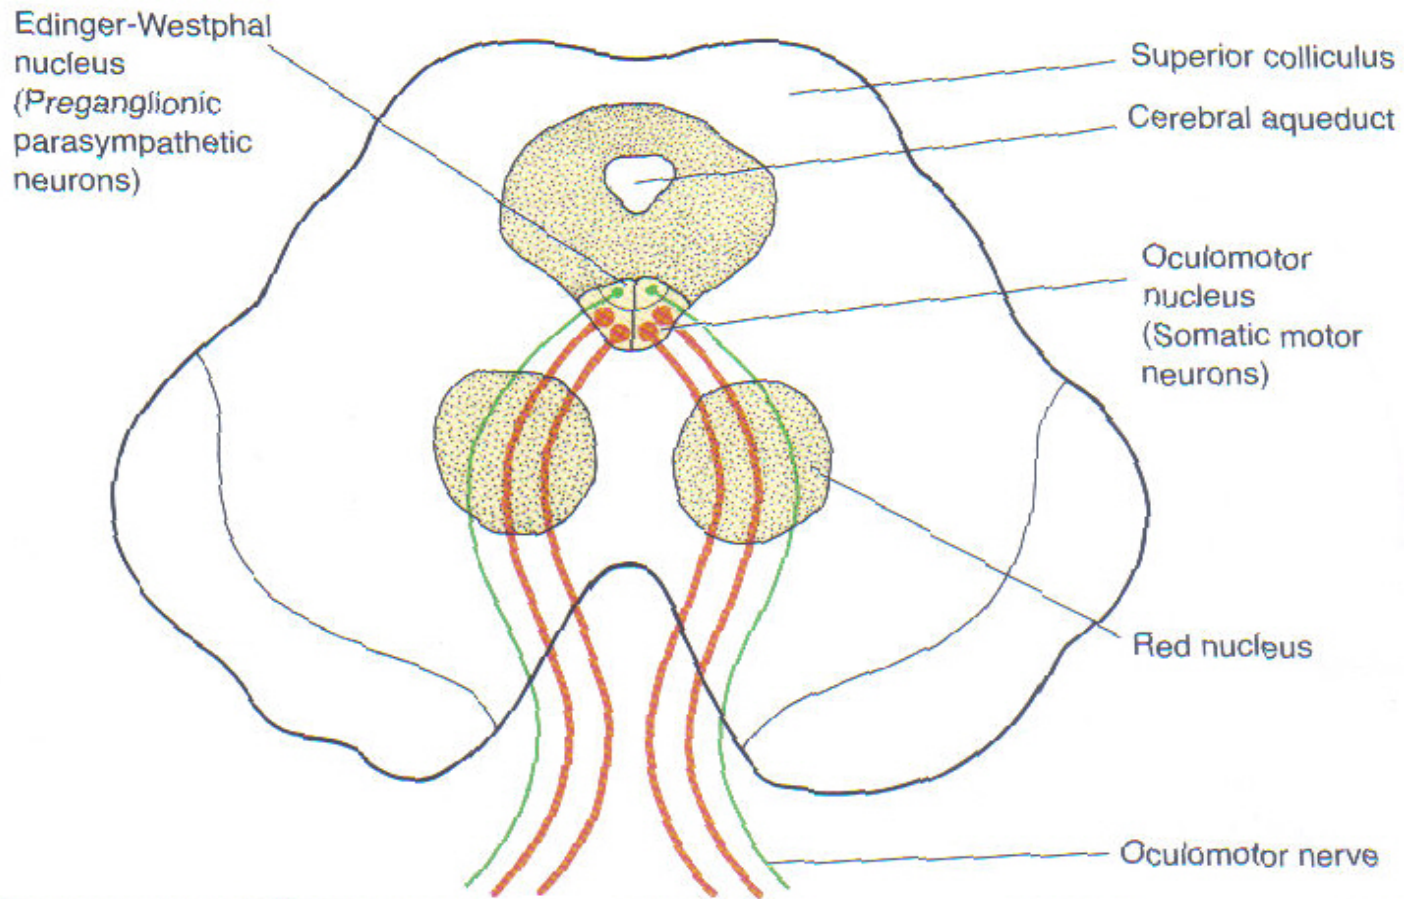

FIGURE 8-2 Origins of the oculomotor nerves in the midbrain at the level of the superior colliculus. Motor neurons are red; preganglionic parasympathetic neurons are green.

1. Oculomotor nucleus (GSE)

- **Motor** to ocular muscles: rectus (superior 對側, inferior 同側 and medial 同側), inferior oblique 同側, levator palpebrae superioris 雙側

2. Edinger-Westphal nucleus (GVE)

- to ciliary ganglion → ciliaris and sphincter pupillae muscles

Copyright © 2009, 2002, 1999, 1993, 1988, 1981 by Mosby, Inc., an affiliate of Elsevier Inc.

Oculomotor nucleus: a series of cell columns or subnuclei
M: medial longitudinal fasciculus
PAG: periaqueductal gray

Cranial Nerve IV: Trochlear

- Fibers emerge from the dorsal midbrain and enter the orbits via the superior orbital fissures; innervate the **superior oblique muscle**
- Primarily a motor nerve that directs the eyeball

Cranial Nerve IV: Trochlear

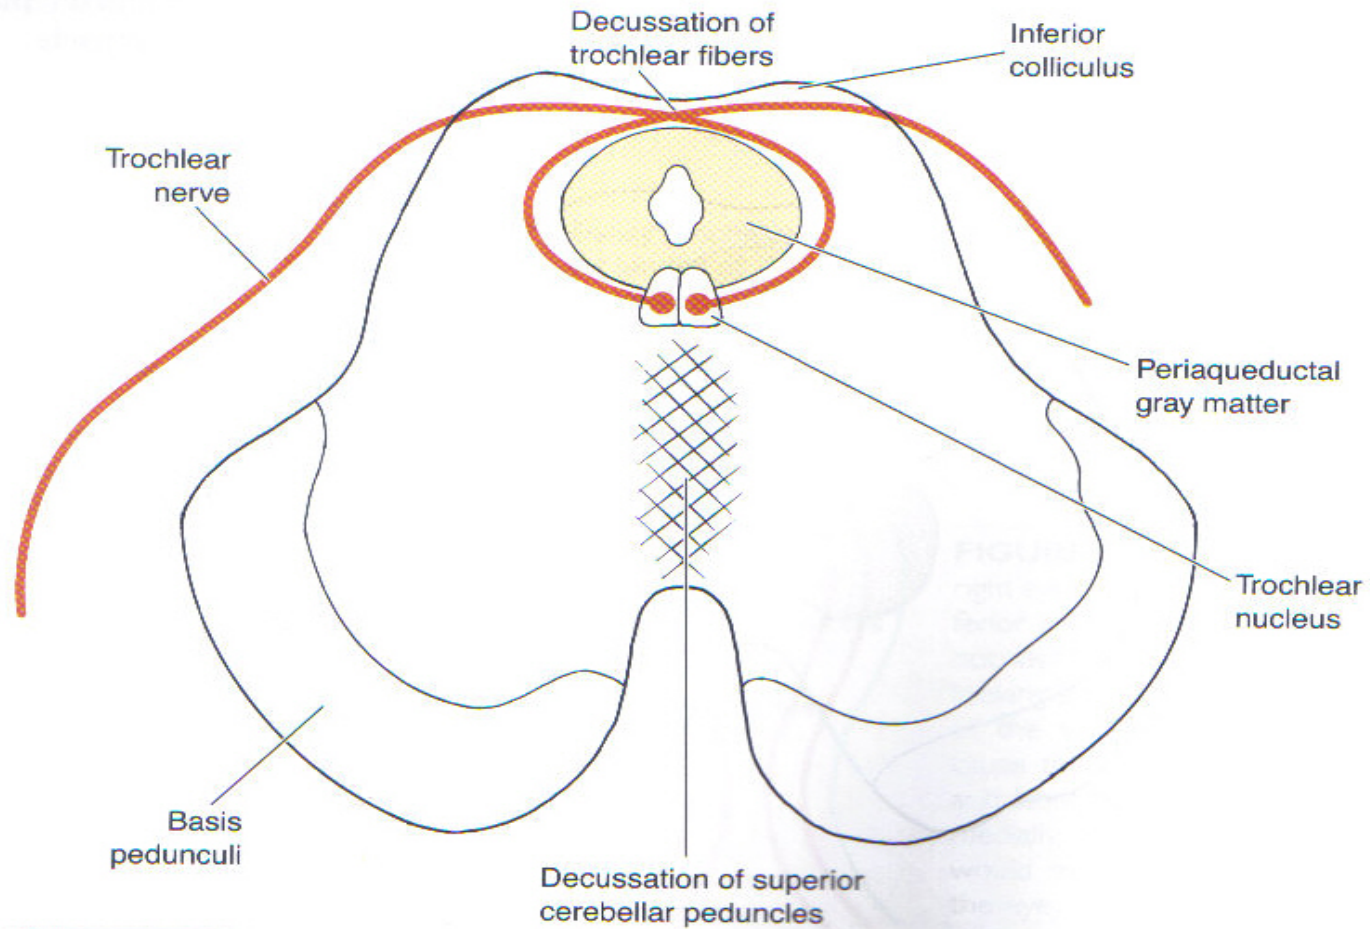

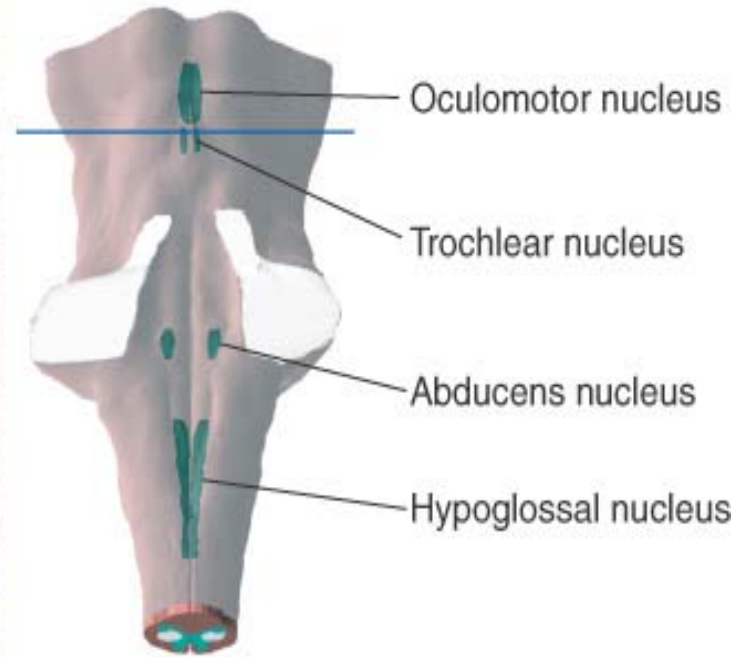

FIGURE 8-3 Origins of the trochlear nerves in the midbrain. The axons from the left and right trochlear nuclei are directed dorsally and caudally; they decussate in the superior medullary velum, which is below the inferior colliculi.

Copyright © 2009, 2002, 1999, 1993, 1988, 1981 by Mosby, Inc., an affiliate of Elsevier Inc.

Trochlear nucleus (GSE)

- To **contralateral (對側)** superior oblique muscle
- Located at the level of the inferior colliculus
- It indents the medial longitudinal fasciculus

Cranial Nerve VI: Abducens

- Fibers leave the inferior pons and enter the orbit via the superior orbital fissure
- Primarily a motor nerve innervating the **lateral rectus muscle**

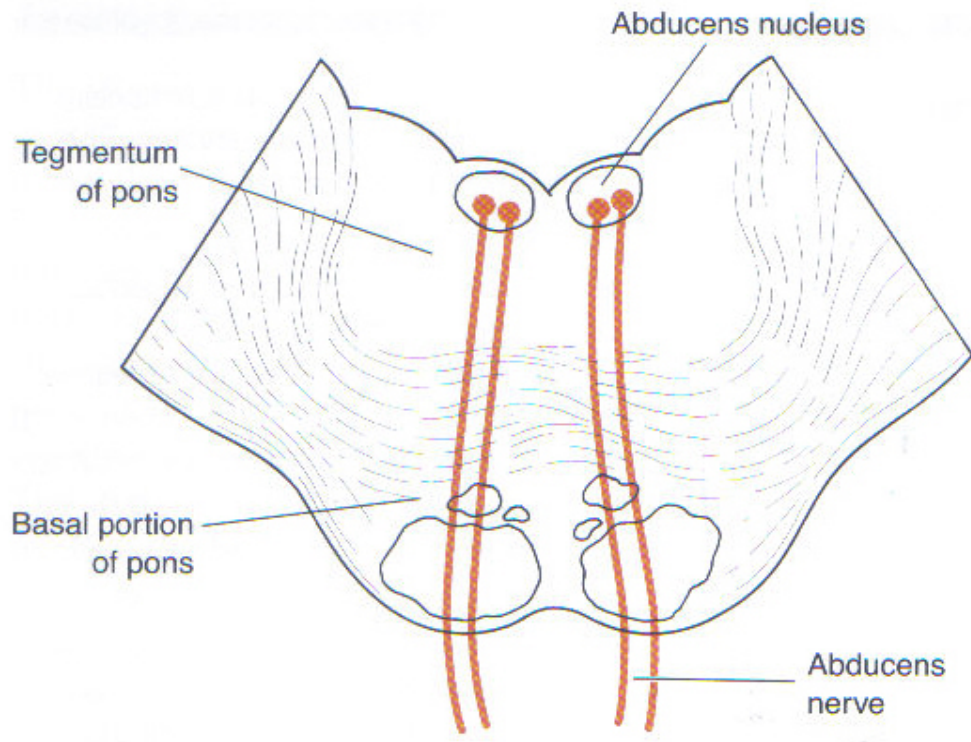

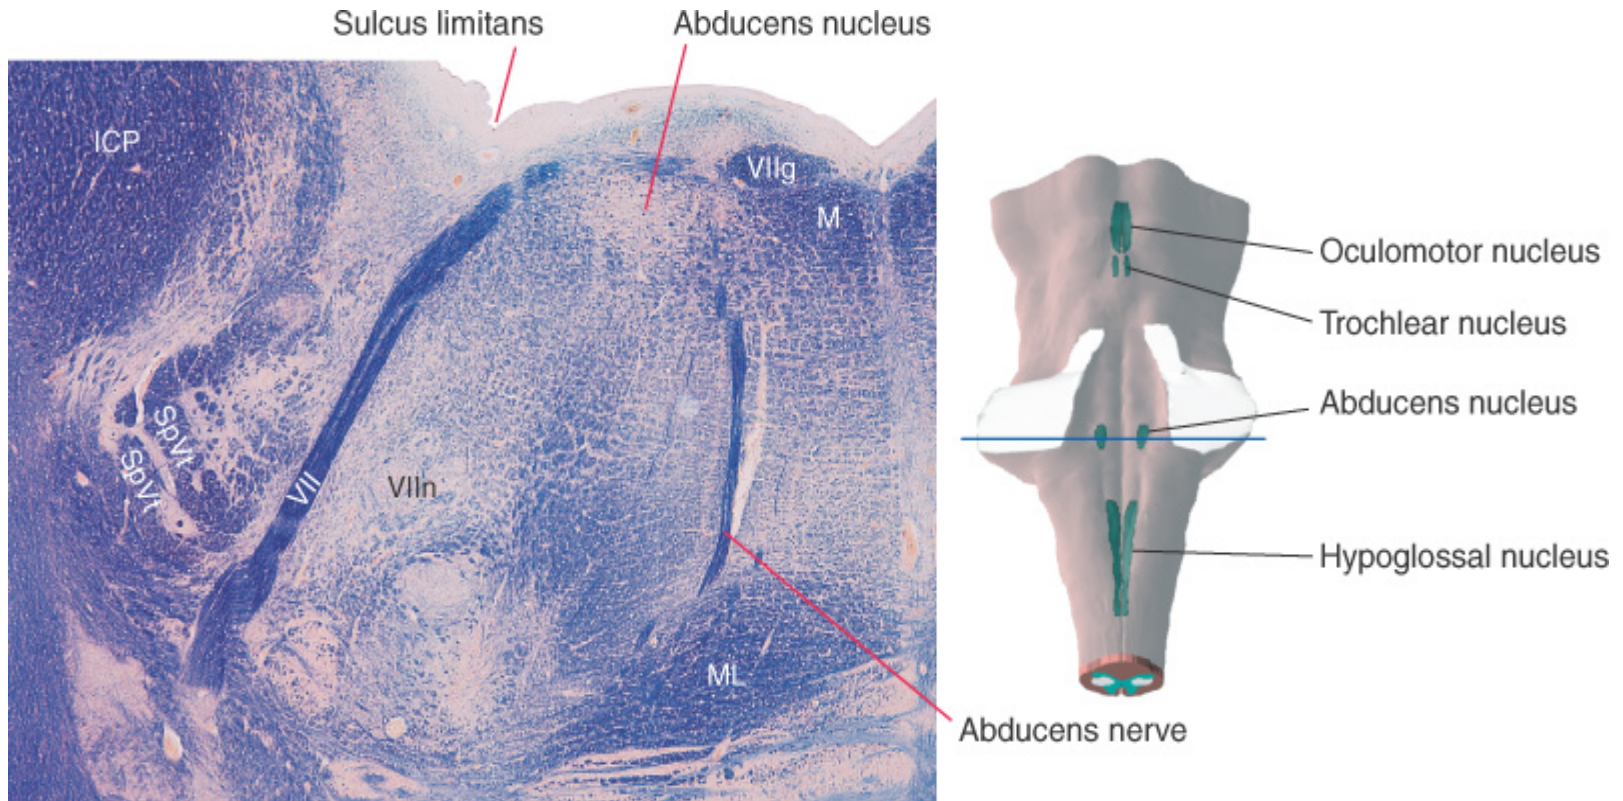

FIGURE 8-4 Origins of the abducens nerves in the caudal part of the pons.

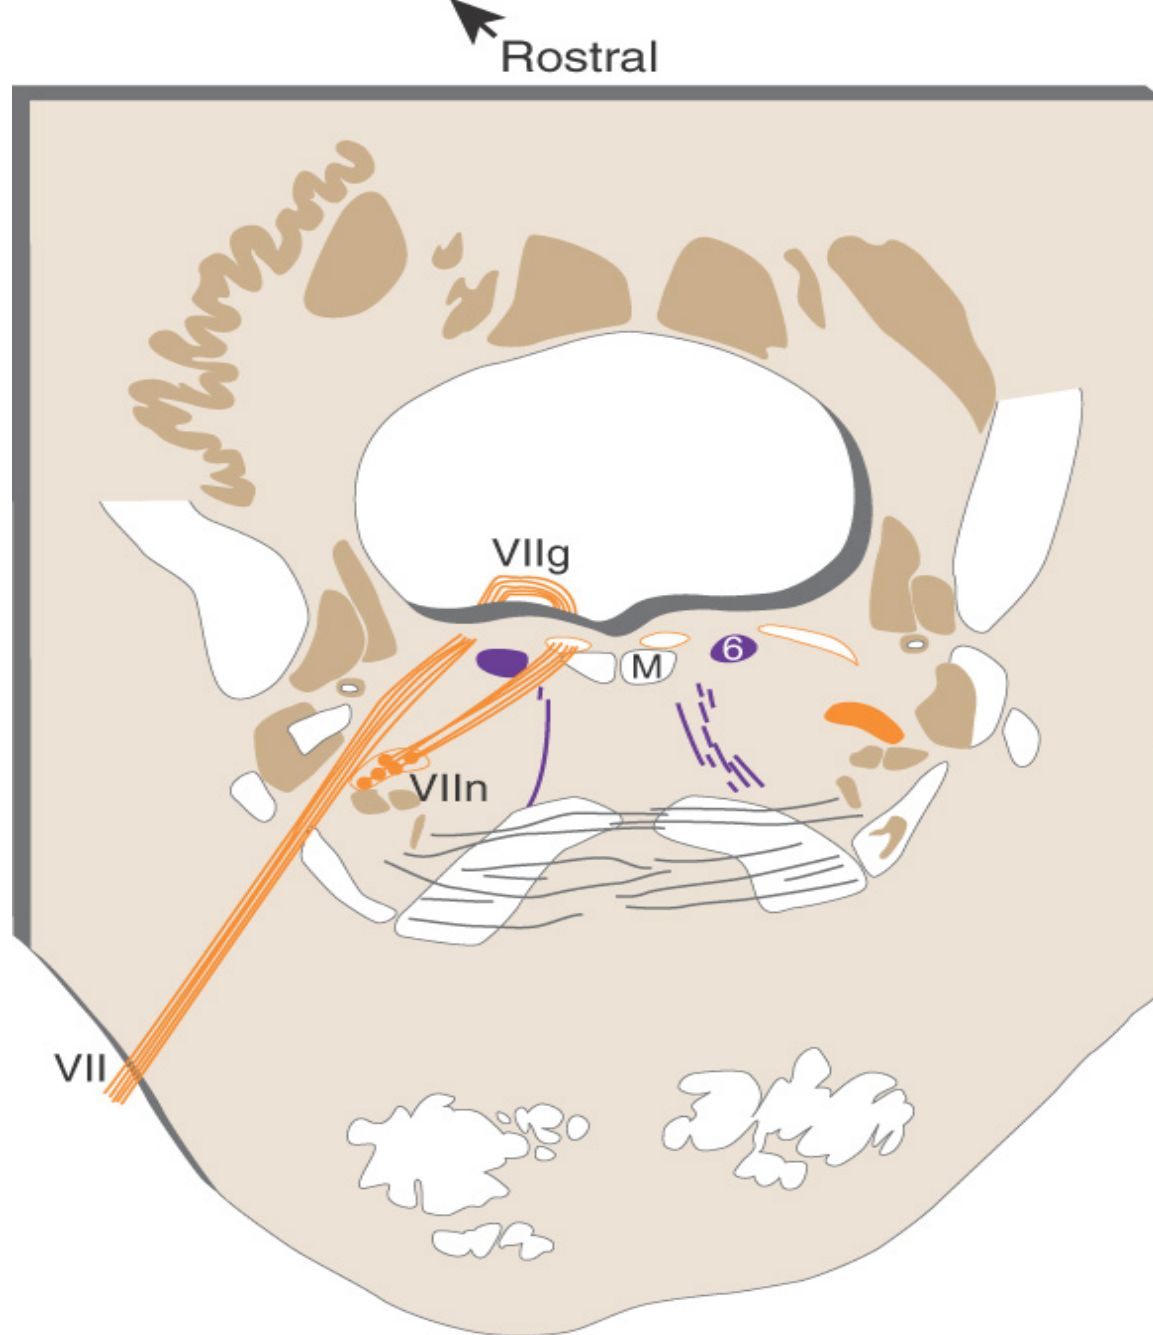

Abducens nucleus (GSE)

- To lateral rectus muscle
- Located in the caudal pons beneath the floor of the 4th ventricle

DMN X: dorsal motor nucleus of the vagus
ST: solitary tract Sol: nucleus of the solitary tract
4V: 4th ventricle

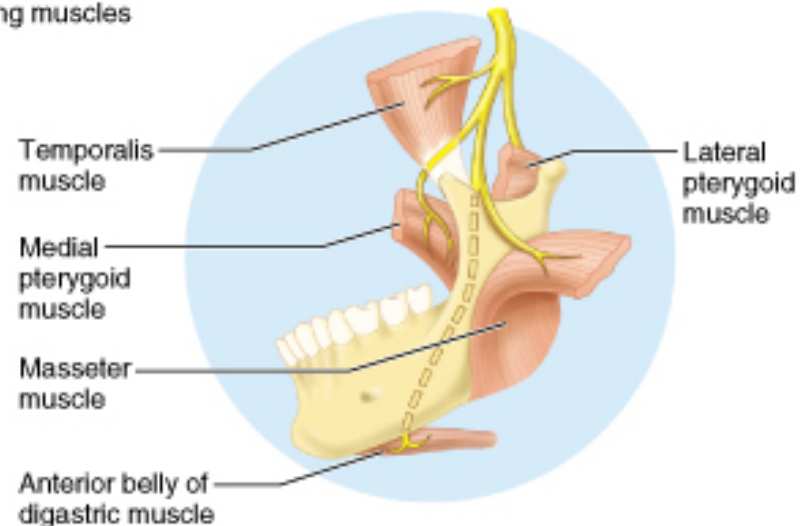

Cranial Nerve V: Trigeminal

- Composed of three divisions: ophthalmic (V_1), maxillary (V_2), and mandibular (V_3)
- Fibers run from the face to the pons via the superior orbital fissure (V_1), the foramen rotundum (V_2), and the foramen ovale (V_3)
- Conveys sensory impulses from various areas of the face (V_1) and (V_2), and supplies motor fibers (V_3) for mastication

Cranial Nerve V: Trigeminal

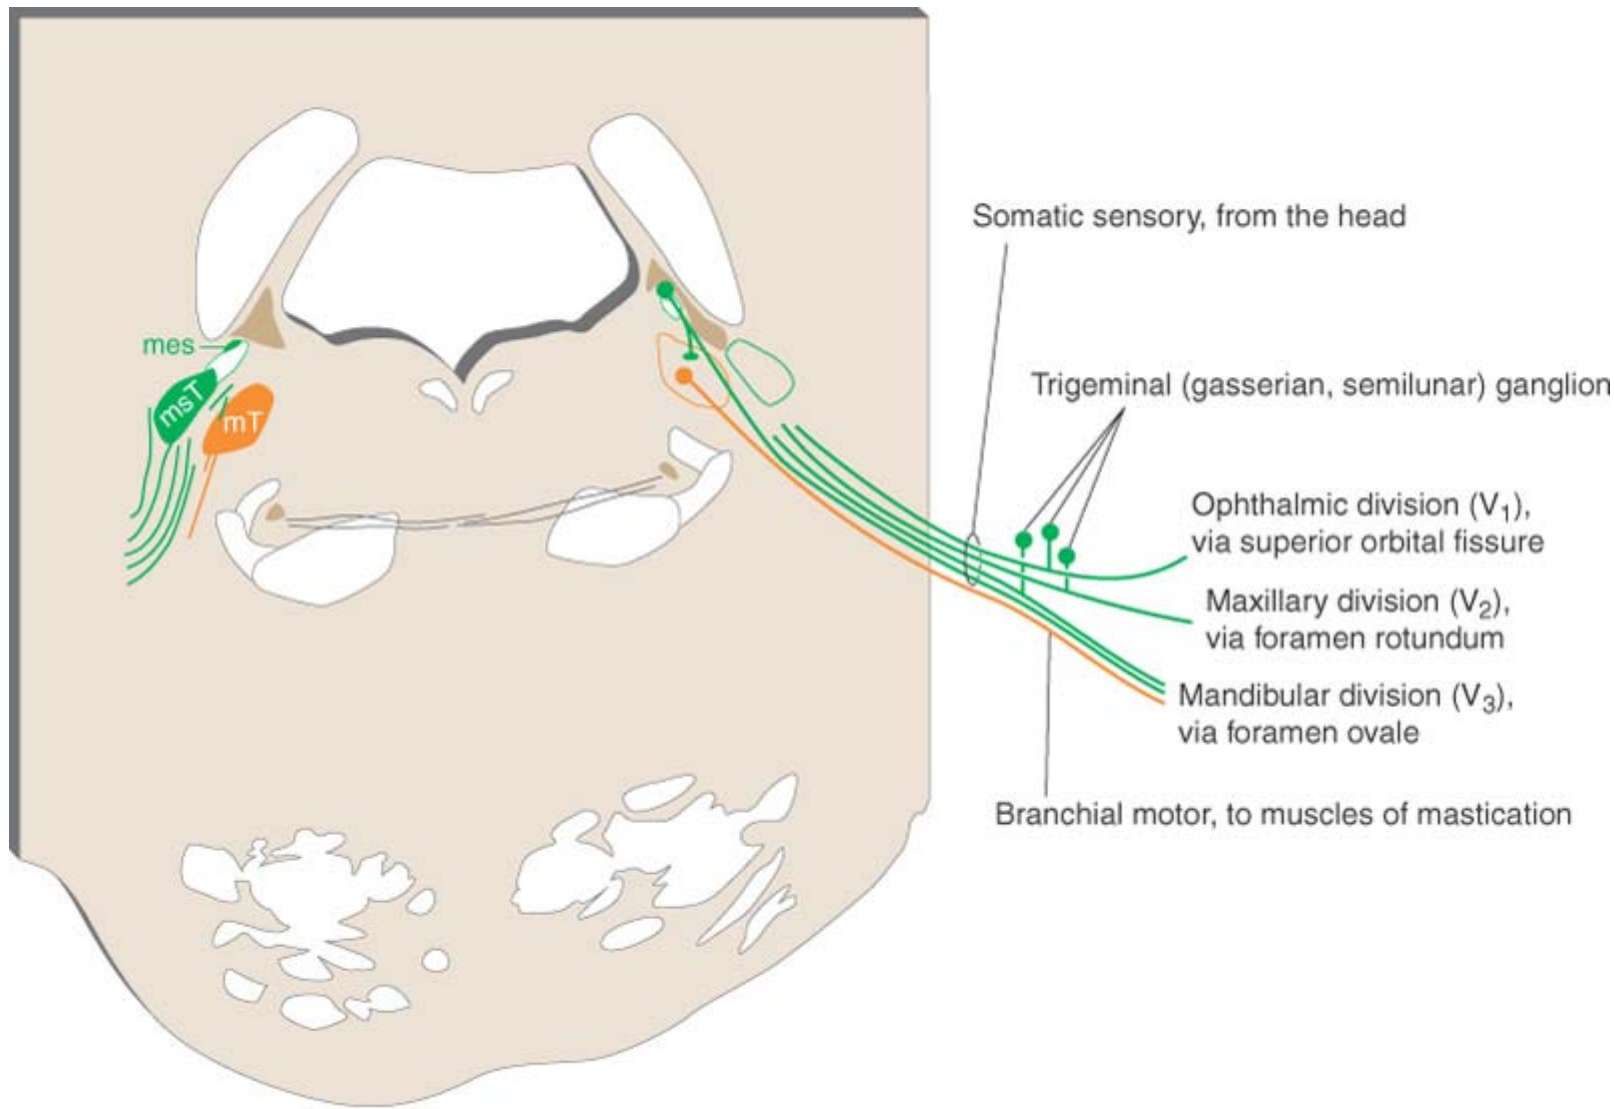

Distribution of sensory fibers of each division

Inset shows motor branches of the mandibular division (V_3)

1. Main sensory nucleus

2. Nucleus of the spinal trigeminal:

receives information of pain and temperature

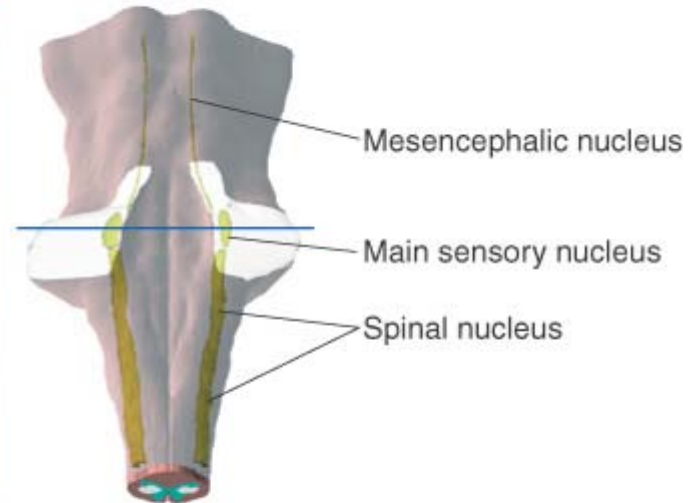

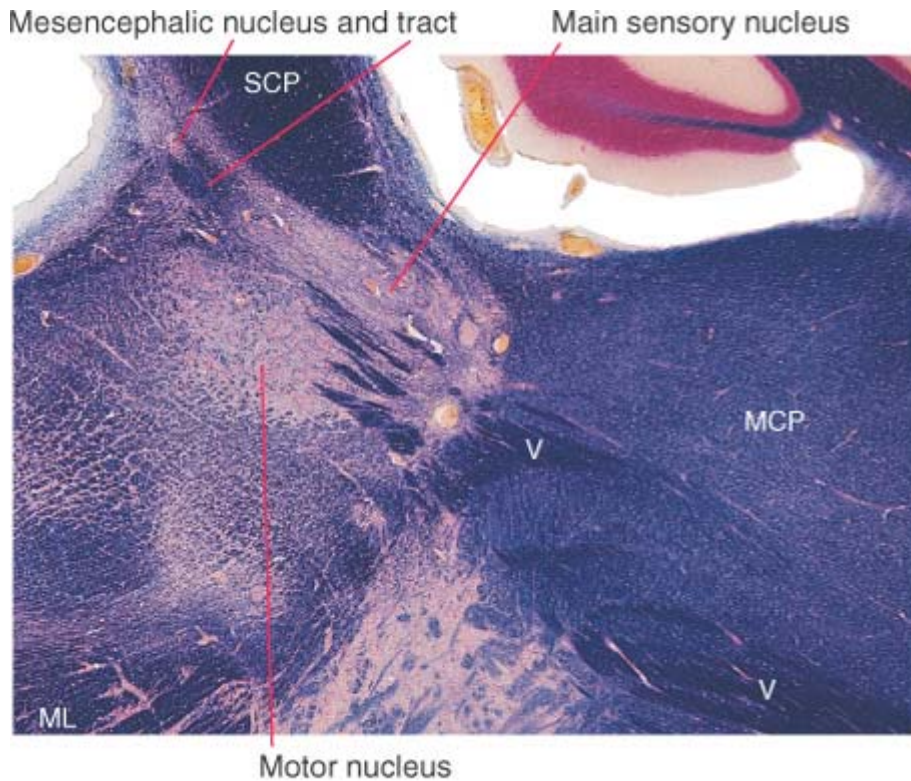

3. Mesencephalic nucleus

Central processes → motor nuclei of trigeminal

Peripheral processes → mandibular division

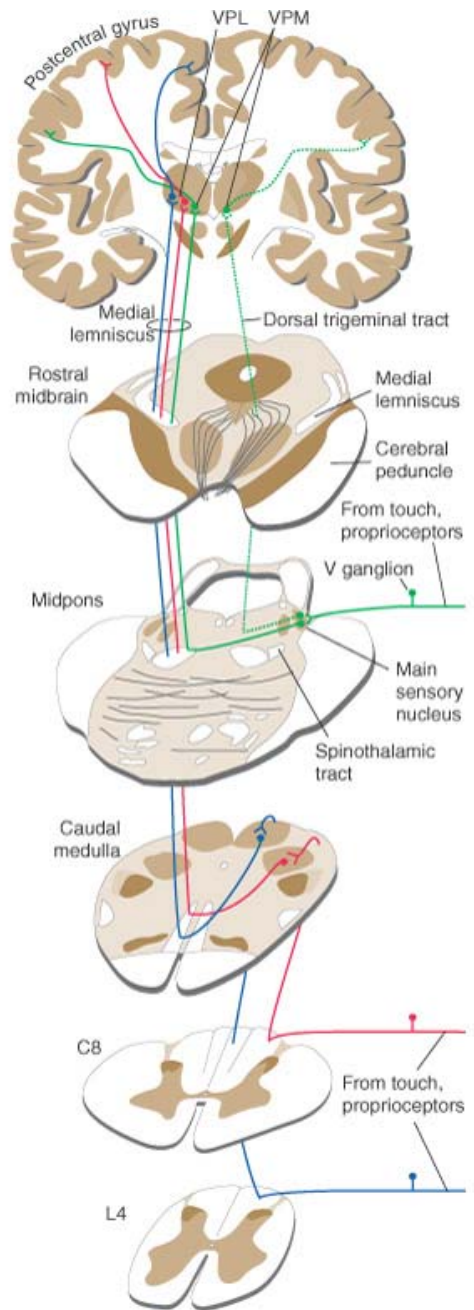

4. Trigeminal motor nucleus (SVE):

inervates muscles of mastication

P: pyramid
FC: fasciculus cuneatus
NC: nucleus cuneatus

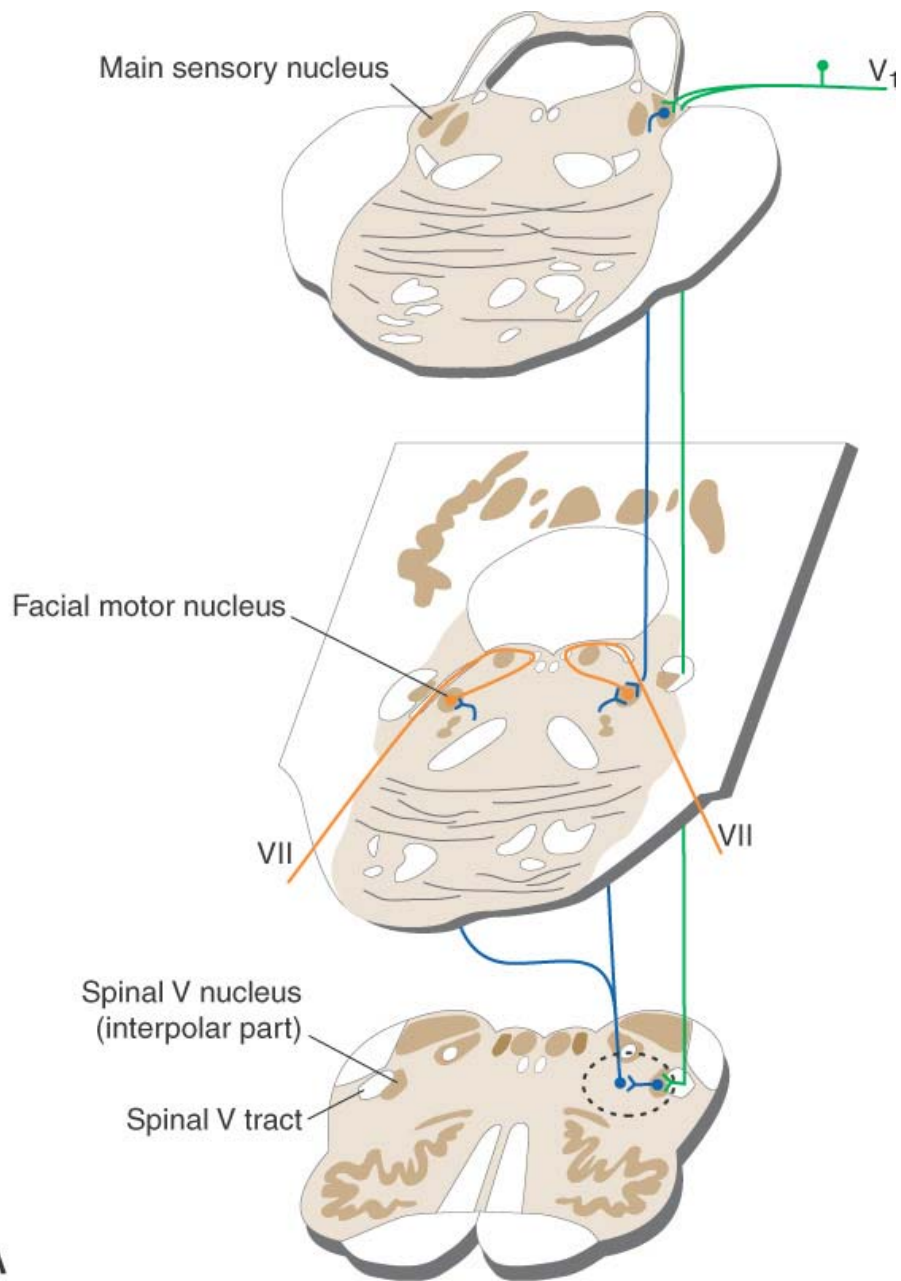

A

Cranial Nerve VII: Facial

- Fibers leave the pons, travel through the internal acoustic meatus, and emerge through the **stylomastoid foramen** to the lateral aspect of the face
- Mixed nerve with five major branches
- Motor functions include facial expression, and the transmittal of autonomic impulses to **lacrimal and salivary** glands
- Sensory function is **taste** from the anterior two-thirds of the tongue

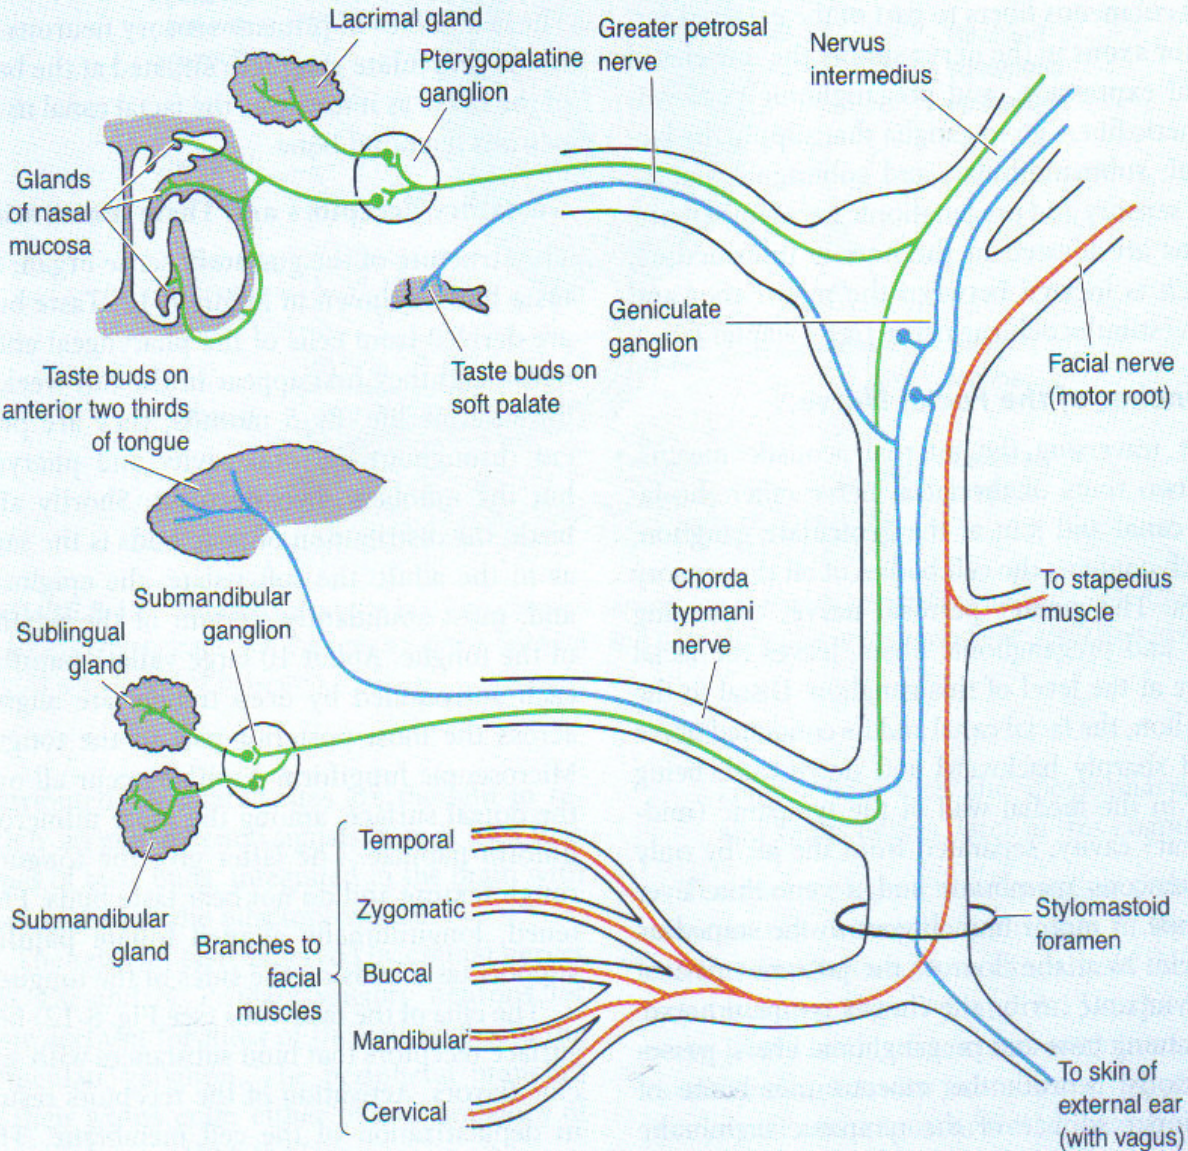

Cranial Nerve VII: Facial

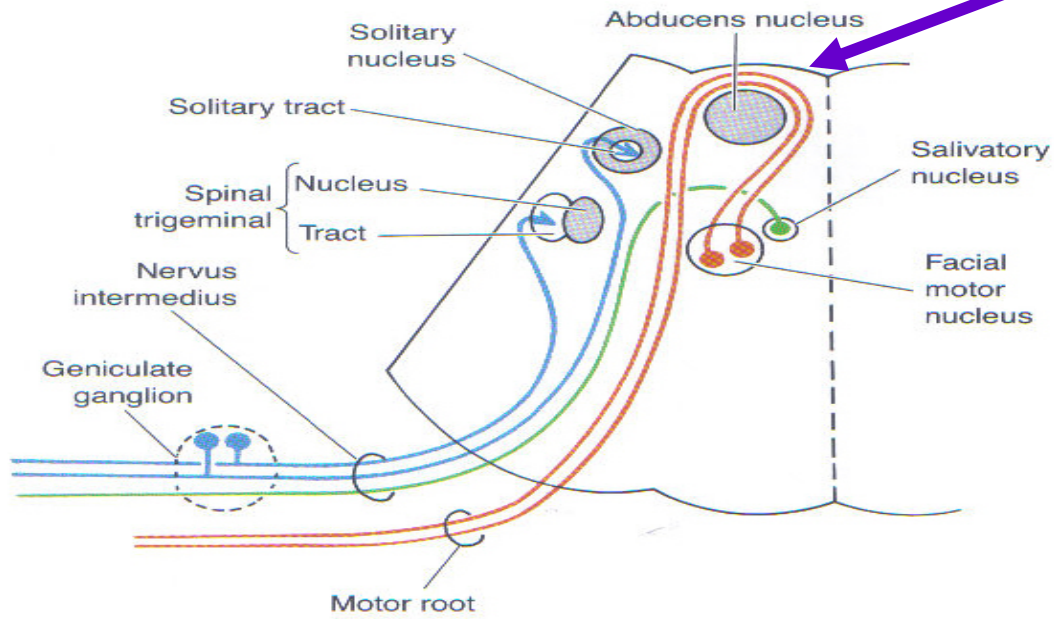

The Facial Nerve and the Middle Ear

The facial nerve is vulnerable in the middle ear, which is a region commonly invaded by bacteria

and surgery. The exact site of a lesion can be determined by applying knowledge of the branches containing different functional components (Fig. 8-11).

Facial colliculus

1. Motor nucleus of facial nerve
(facial nucleus)

2. Superior salivatory nucleus

To chorda tympani branch and join the
lingual branch of C.N. V₃

3. Lacrimal nucleus

To greater petrosal branch and terminate
the pterygopalatine ganglion

1. Geniculate ganglion

Central processes → nervus intermedius

Peripheral processes → chorda tympani, greater petrosal and lesser palatine

(some fibers join the auricular branch of the vagus)

2. Gustatory nucleus

(The large-celled rostral part of the nucleus of the tractus solitarius)

Enter the brain in the nervus intermedius and turn in the tractus solitarius, then terminate in the nucleus of the tractus solitarius

3. Nucleus of spinal trigeminal tract

From the nervus intermedius

Taste

From taste buds (VII, IX, X)

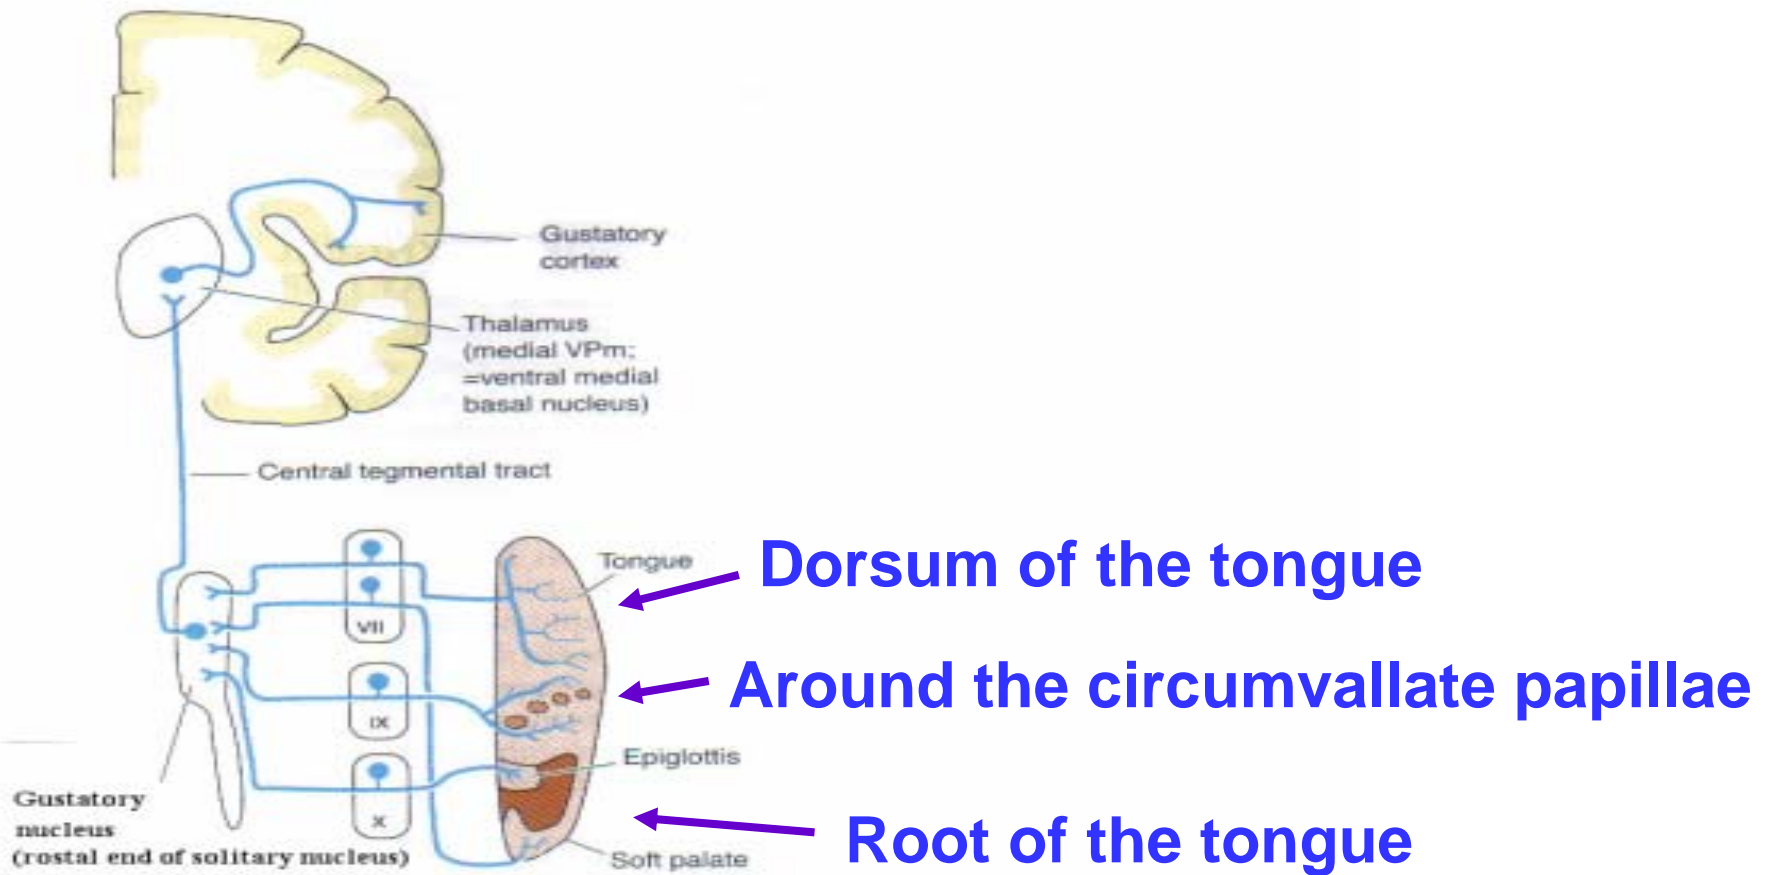

From viscera (VII, IX, X)

A

Taste sensation

- Facial
- Glossopharyngeal
- Vagus

Cranial Nerve VIII: Vestibulocochlear

- Fibers arise from the hearing and equilibrium apparatus of the inner ear, pass through the internal acoustic meatus, and enter the brainstem at the pons-medulla border
- Two divisions – cochlear (hearing) and vestibular (balance)
- Functions are solely sensory for the sense of equilibrium and of hearing

Cranial Nerve VIII: Vestibulocochlear

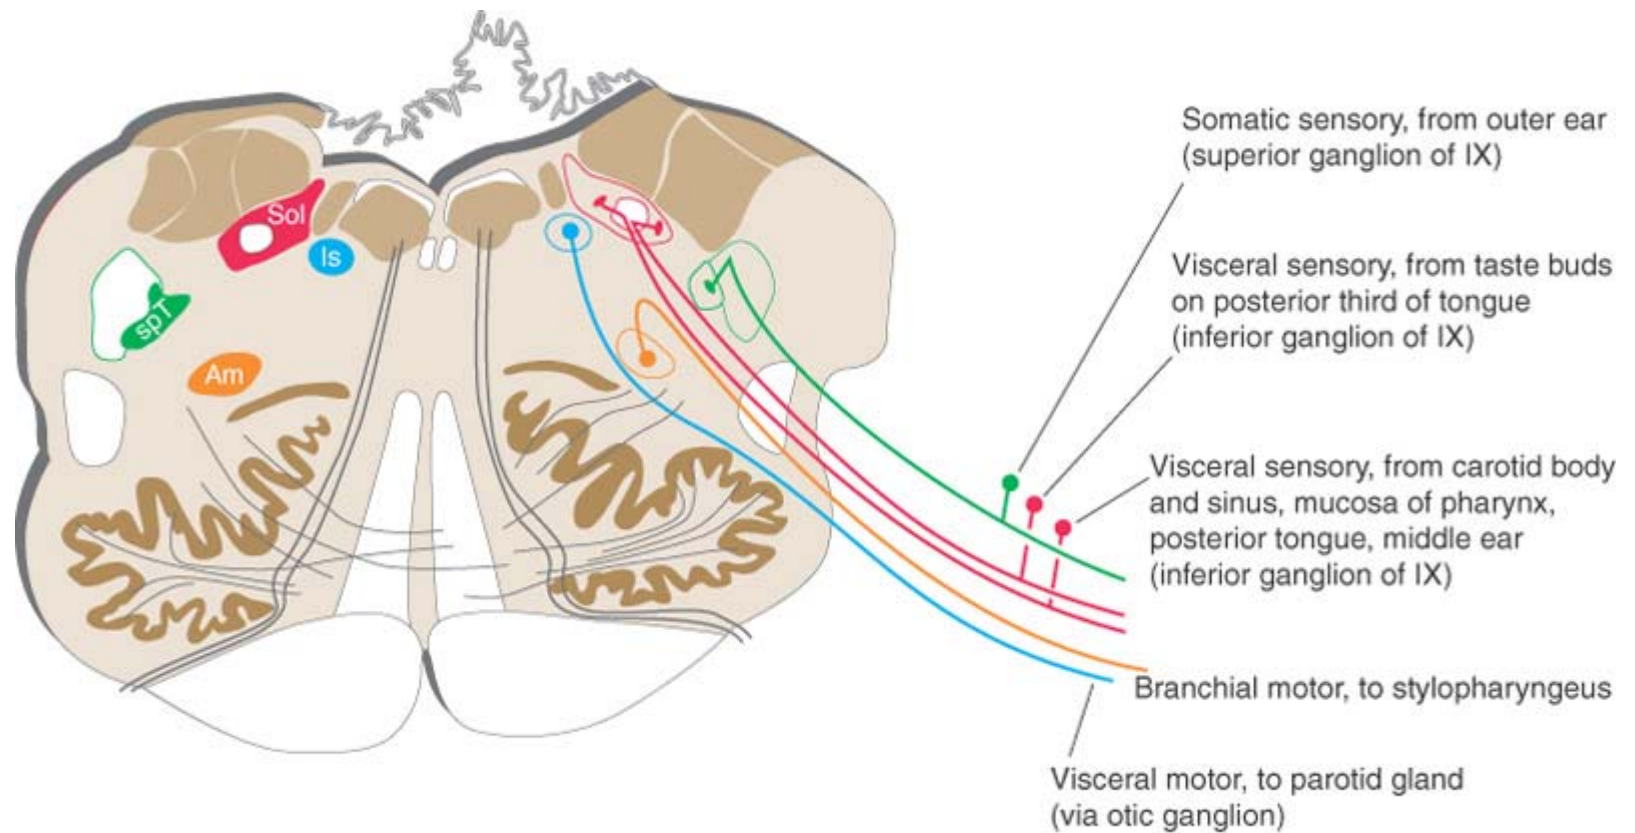

Cranial Nerve IX: Glossopharyngeal

- Fibers emerge from the medulla, leave the skull via the jugular foramen, and run to the throat
- Nerve IX is a mixed nerve with motor and sensory functions
- Motor – innervates part of the tongue and pharynx, and provides motor fibers to the parotid gland
- Sensory – fibers conduct taste and general sensory impulses from the tongue and pharynx

Cranial Nerve IX: Glossopharyngeal

1. Nucleus ambiguus (SVE)
 - Branchial motor to stylopharyngeus
2. Inferior salivary nucleus (GVE)
 - to parotid gland (via otic ganglion)

3. Spinal trigeminal nucleus

- Somatic sensory from outer ear (superior ganglion of IX)

4. Nucleus of the solitary tract

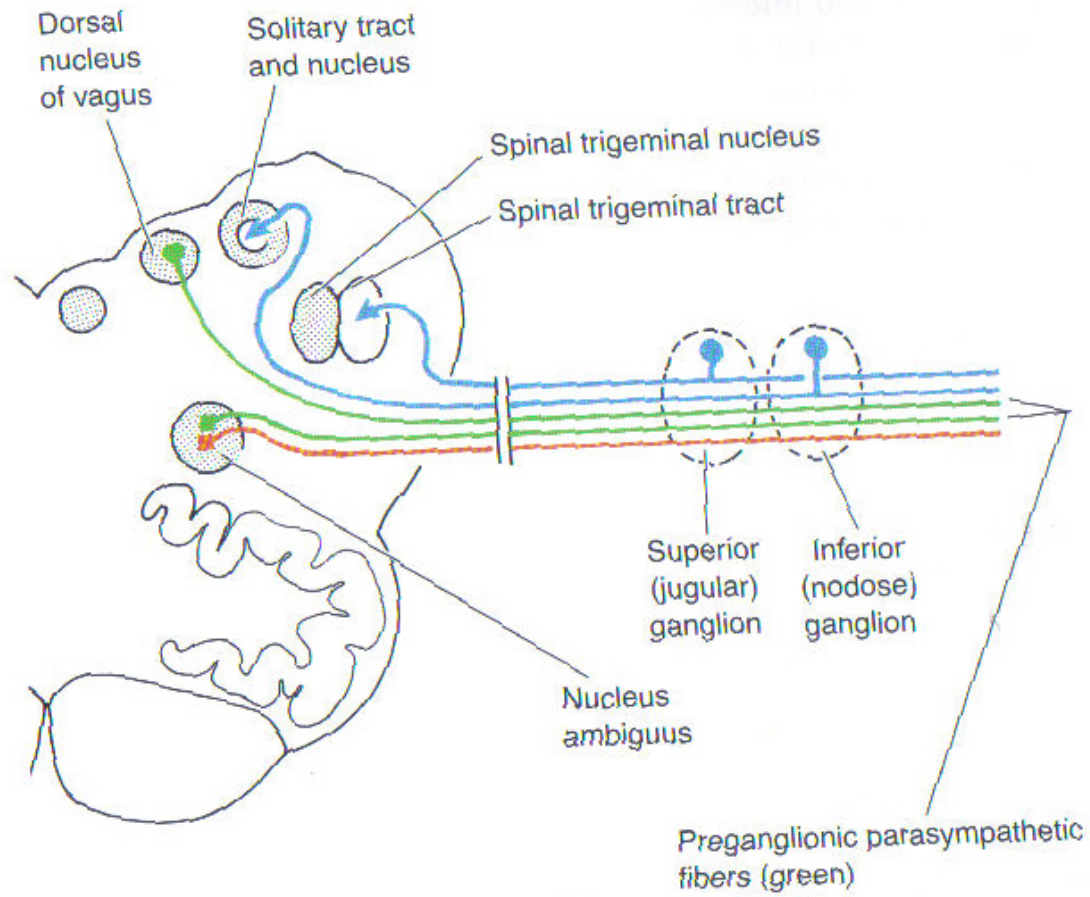

- Visceral sensory from carotid body and sinus, mucosa of pharynx, posterior tongue, middle ear (inferior ganglion of IX)
- Visceral sensory from taste buds on posterior third of tongue (inferior ganglion of IX)

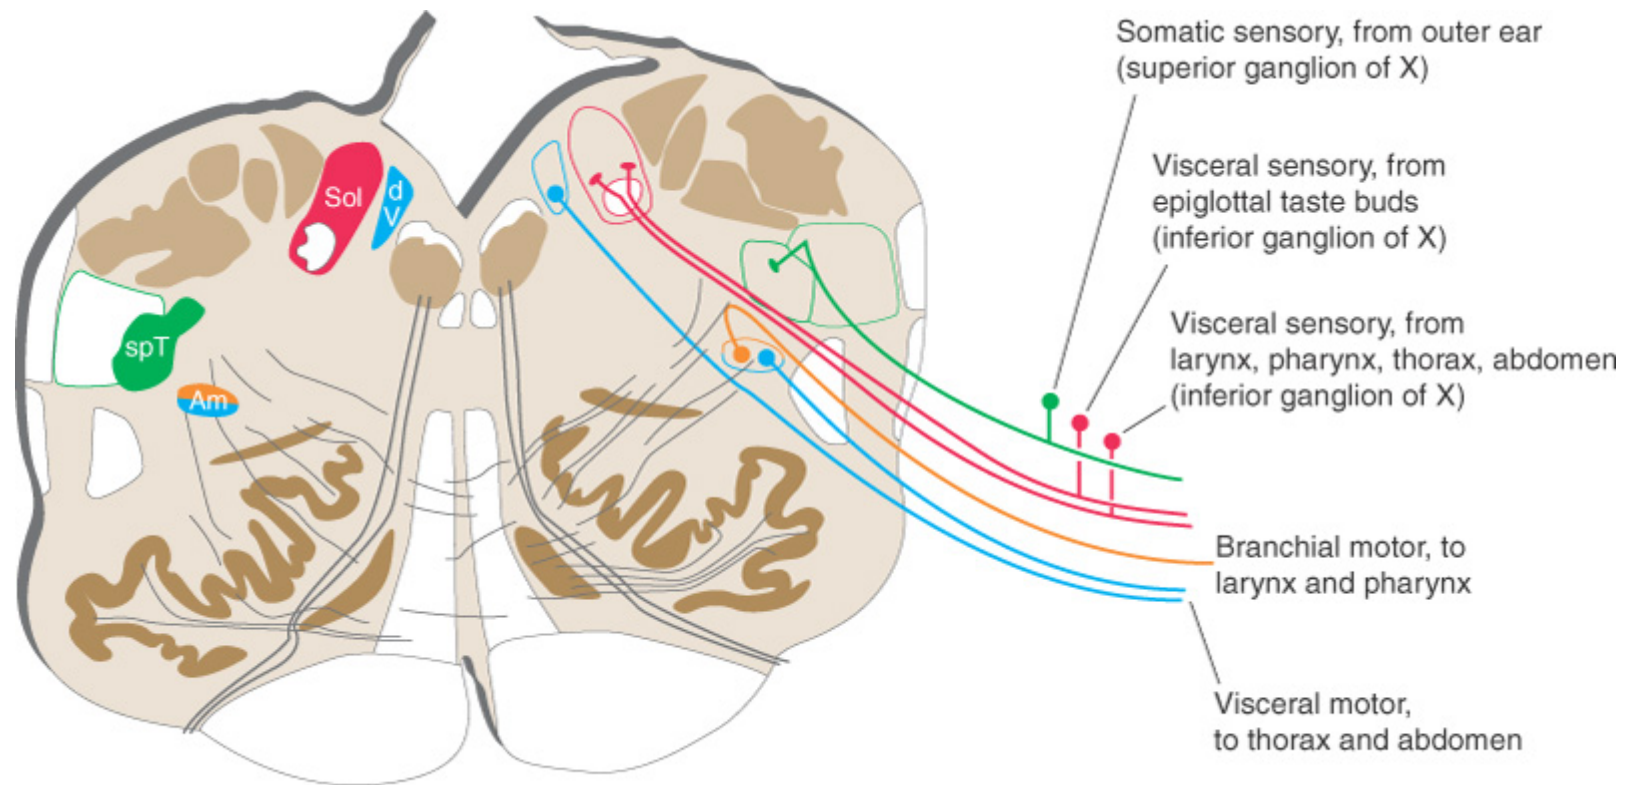

Cranial Nerve X: Vagus

- The only cranial nerve that extends beyond the head and neck
- Fibers emerge from the medulla and emerge via the jugular foramen
- The vagus is a mixed nerve
- Most motor fibers are parasympathetic fibers to the heart, lungs, and visceral organs
- Its sensory function is in taste

Cranial Nerve X: Vagus

Copyright © 2009, 2002, 1999, 1993, 1988, 1981 by Mosby, Inc., an affiliate of Elsevier Inc.

1. Nucleus ambiguus (SVE)

- A hybrid nucleus
- **Branchial motor** to larynx and pharynx and **autonomic motor** to thorax and abdomen

2. dorsal motor nucleus (GVE)

- **autonomic motor** to thorax and abdomen

3. Spinal trigeminal nucleus

- **Somatic sensory** from outer ear (superior ganglion of X)

4. Nucleus of the solitary tract

- **Visceral sensory** from larynx , pharynx ,thorax and abdomen (inferior ganglion of X)

Cranial Nerve XI: Accessory

- The **spinal root** passes upward into the cranium via the foramen magnum
- The accessory nerve leaves the cranium via the jugular foramen
- Primarily a motor nerve supplying:
 - Fibers to the larynx, pharynx, and soft palate
 - Innervates the trapezius and sternocleidomastoid, which move the head and neck

Cranial Nerve XI: Accessory

C1 - accessory nerve

- Formed from a **cranial root** emerging from the medulla and a **spinal root** arising from the superior region of the spinal cord

1. **Cranial root**

Nucleus ambiguus (**SVE**)

2. Spinal root

Spinal accessory nuclei (GSE)

Cranial Nerve XII: Hypoglossal

- Fibers arise from the medulla and exit the skull via the **hypoglossal canal**
- Innervates both extrinsic and intrinsic muscles of the tongue, which contribute to swallowing and speech

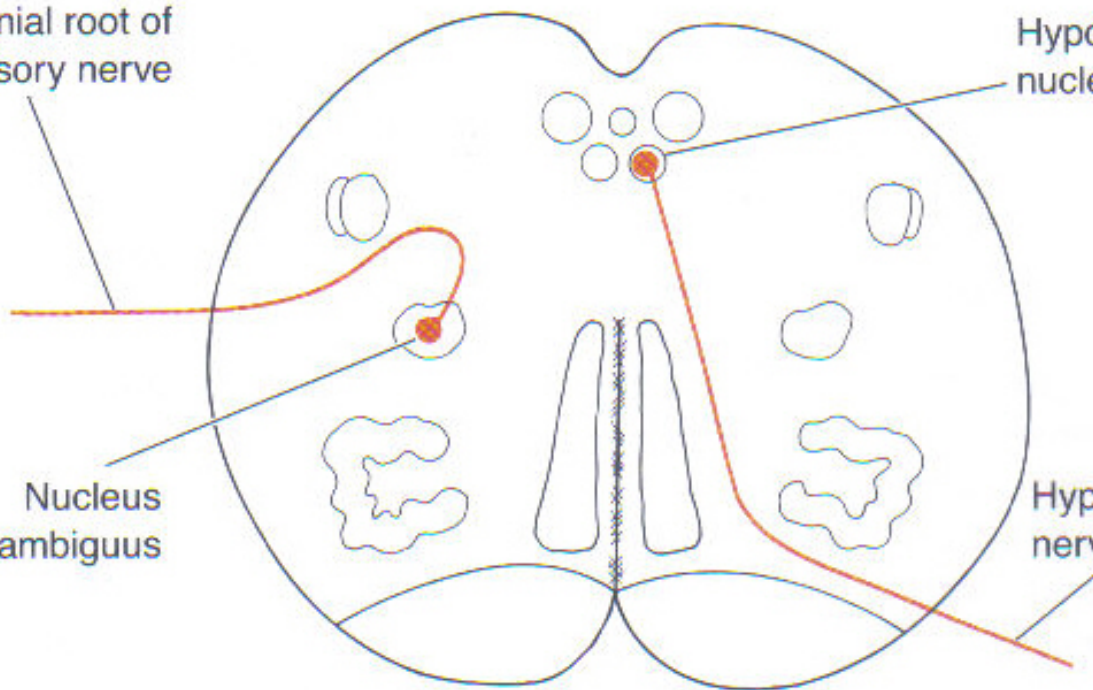

Cranial root of accessory nerve

Hypoglossal nucleus

Nucleus ambiguus

Hypoglossal nerve

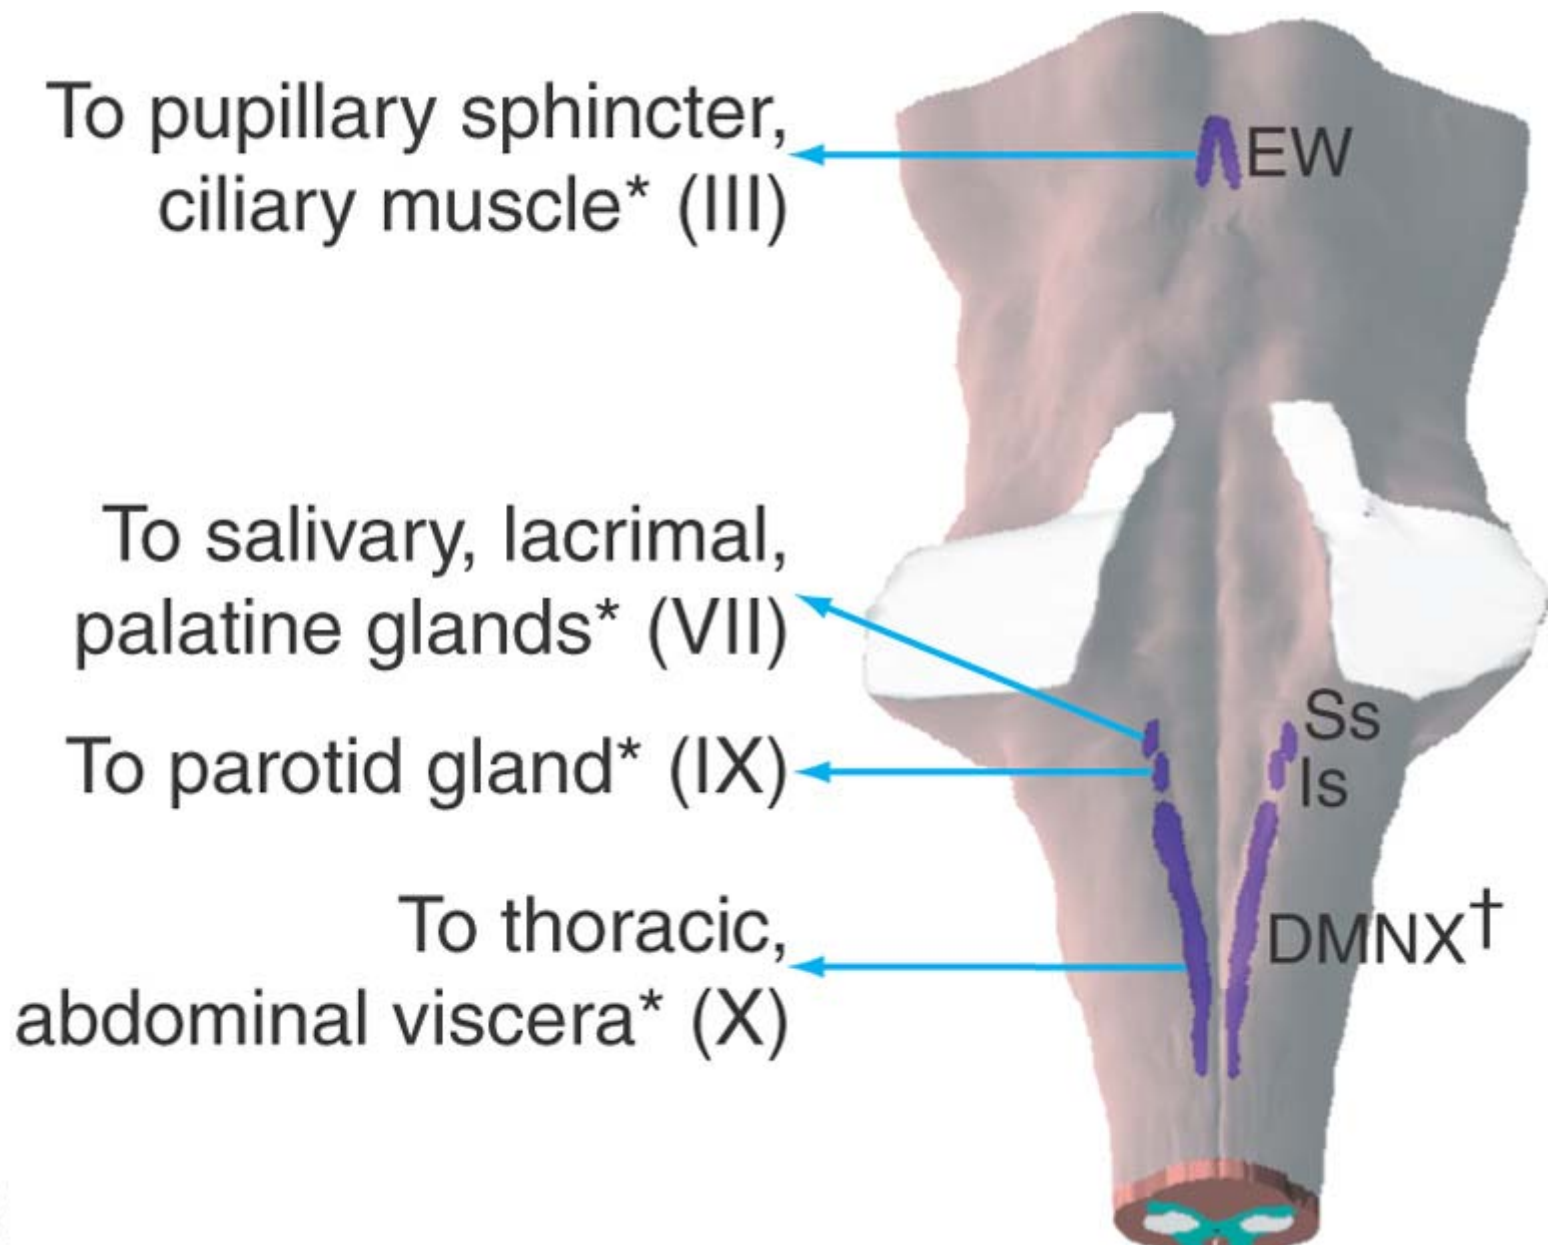

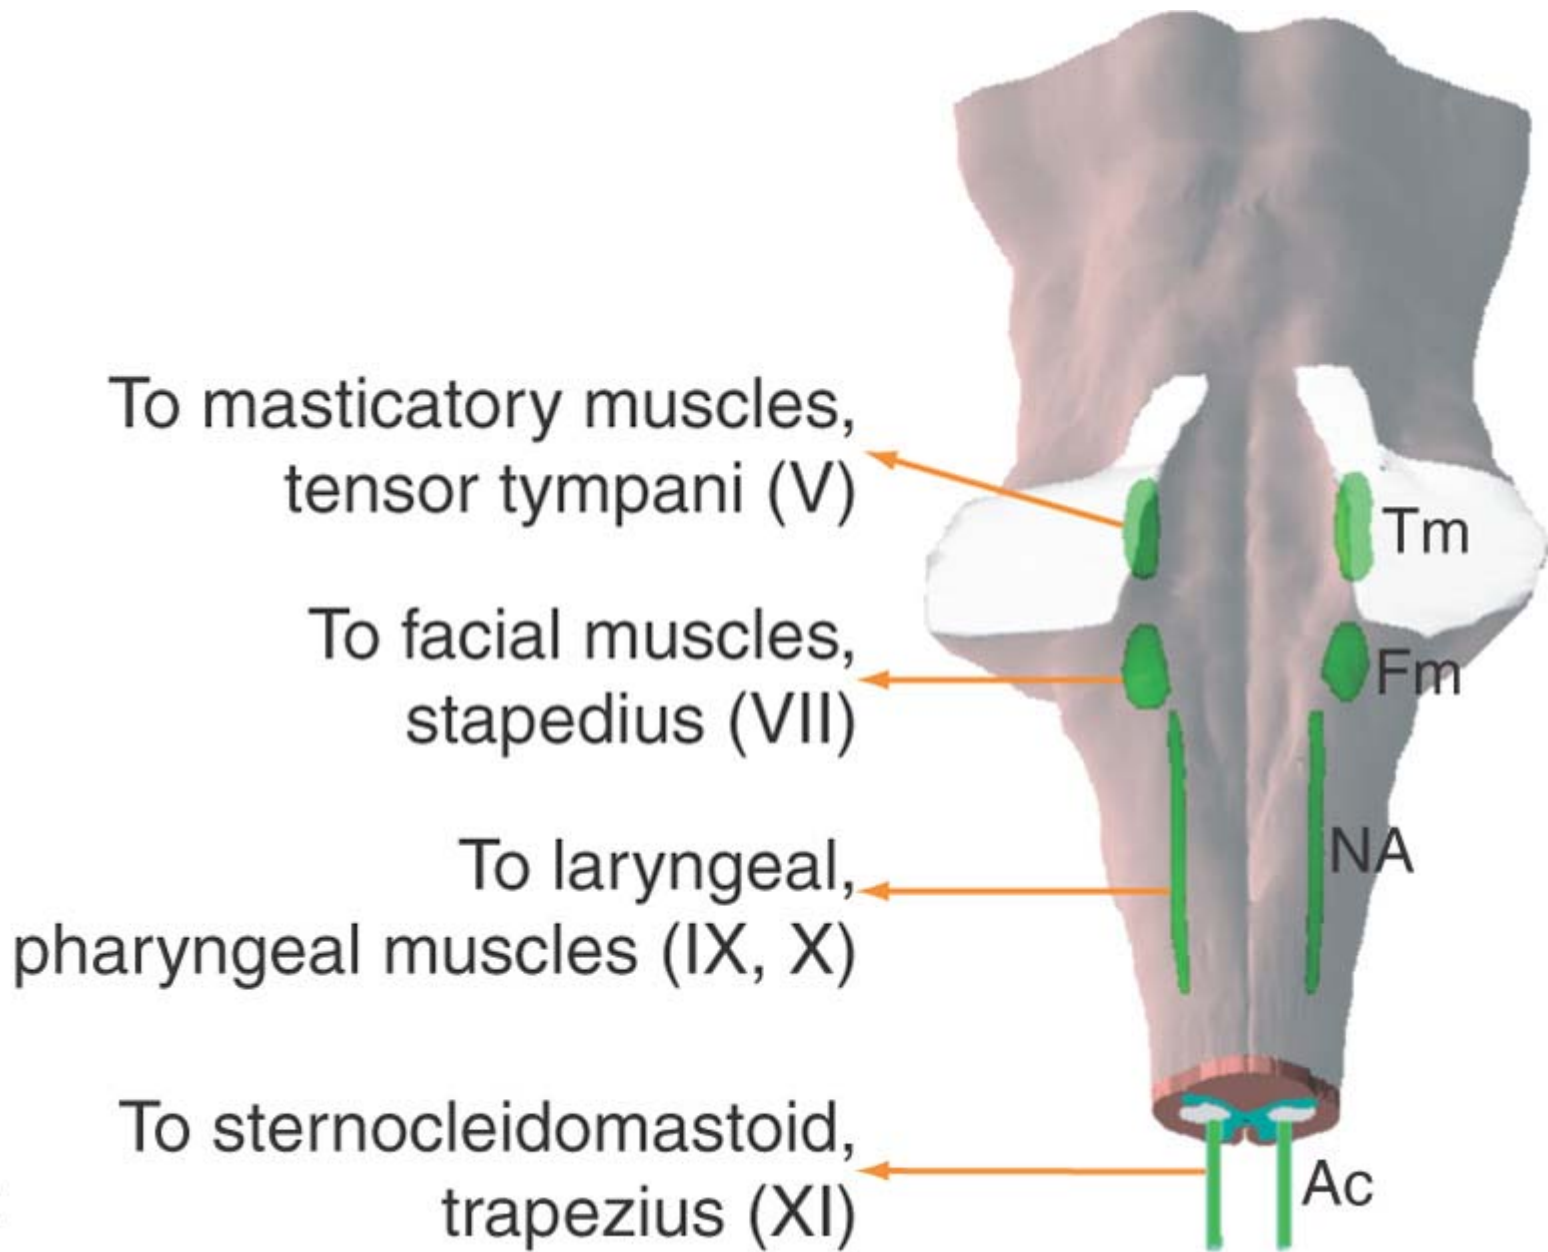

Hypoglossal nucleus

- Lying between the dorsal nucleus of the vagus and the midline of the medulla
- Sends off GSE fibers

Parasympathetic ganglion

- Ciliary ganglion
- Pterygopalatine ganglion
- Submandibular ganglion
- Otic ganglion

C
