

nous hormonal support earlier seems to be justified. In addition, the timing of the "luteo-placental shift" made no difference between singleton and multiple pregnancies.

Several investigators have reported higher pregnancy rates when utilizing other assisted reproductive techniques like GIFT and TET. However, based on the above results, it is likely that the use of nonanonymous donor oocytes for IVF-ET can achieve comparable pregnancy rates. Being noninvasive, by avoiding the morbidity of anesthesia and surgery, and by being less expensive, IVF-ET stands out as the first choice for POF women.
